

# **Patient-specific pathway analysis using PARADIGM identifies key activities in multiple cancers**

**Josh Stuart, UC Santa Cruz**

**AACR-NCI-EORTC International Conference**

**San Francisco, CA, Nov 15, 2011**

# Disclosures

- SAB and stock owner of Five<sup>3</sup> Genomics.
- All work presented part of TCGA consortium.

# Flood of Data Analysis Challenges

# Analysis of disease samples like Investigating a series of different car breakdowns

Patient Sample 1

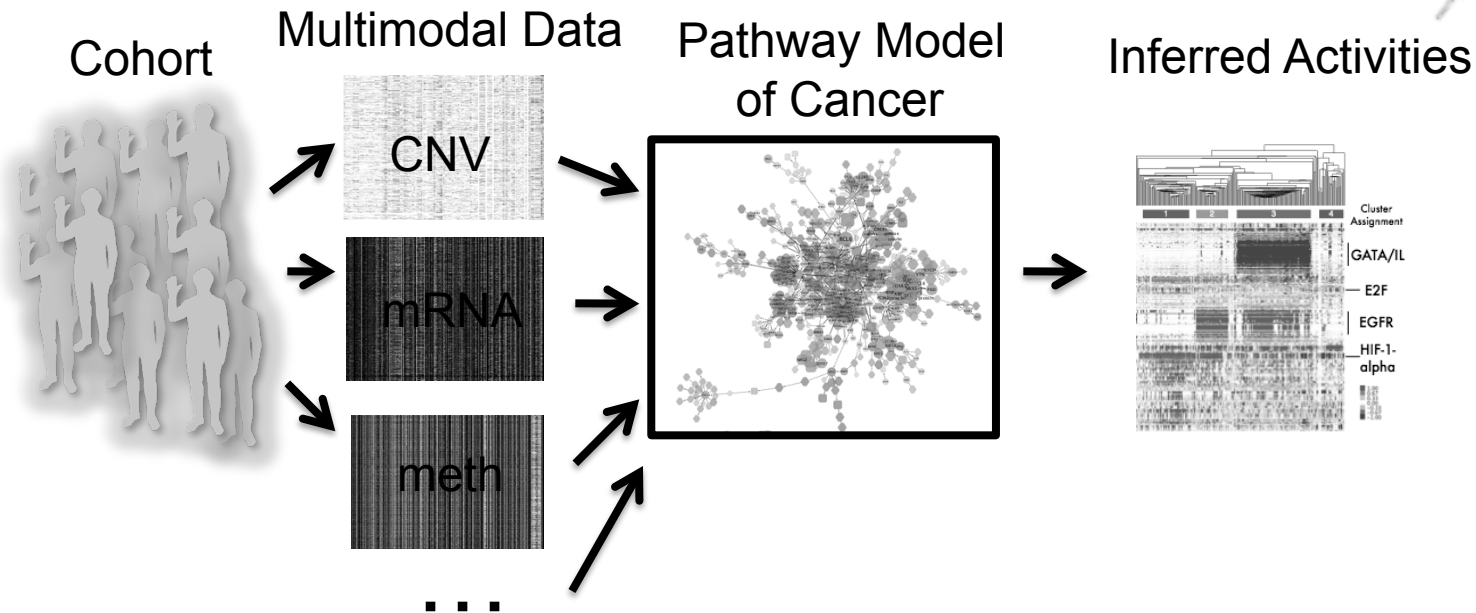

Patient Sample 2

In diagnosis use as much  
knowledge about how systems work  
as possible.

# Integrated Pathway Analysis for Cancer

- Integrated dataset for downstream analysis
- Inferred activities reflect neighborhood of influence around a gene.
- Can boost signal for survival analysis and mutation impact

# Outline

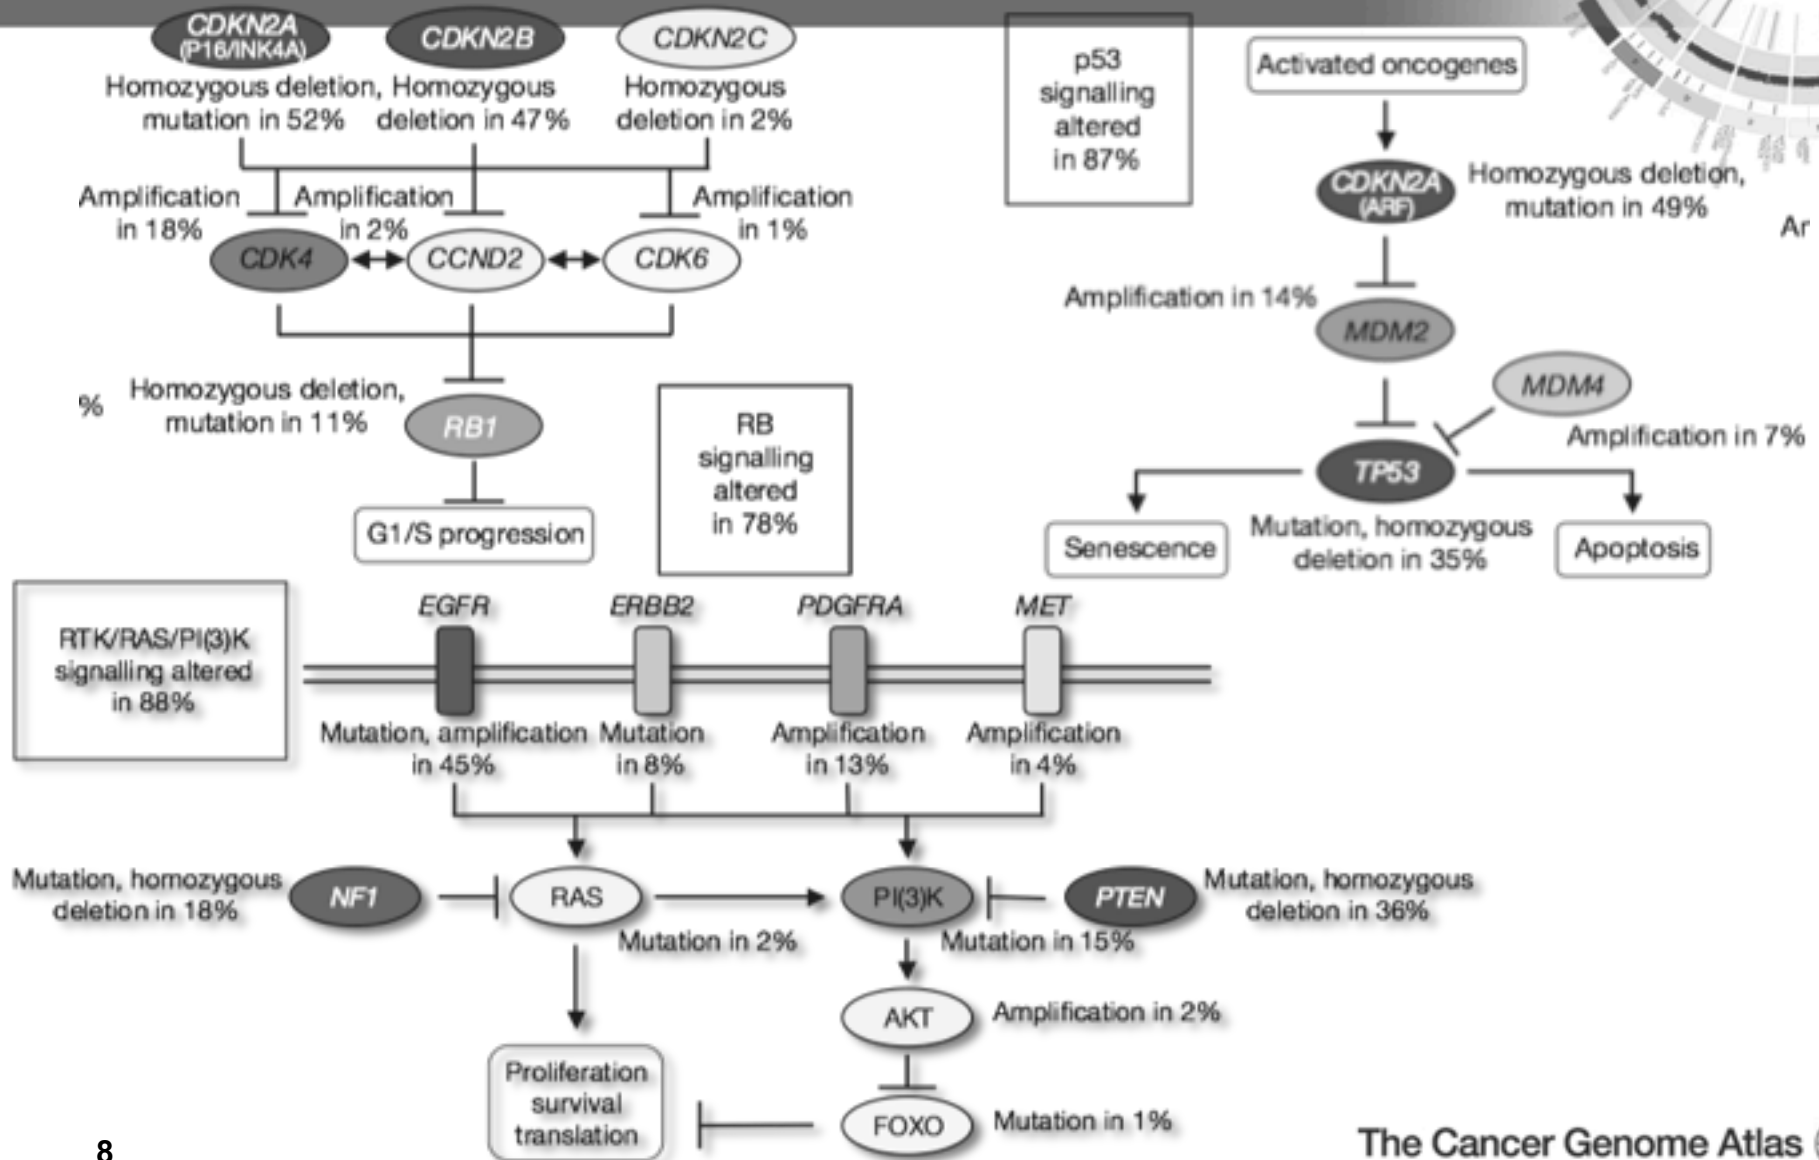

- Integrated Pathway Approach
- Application to find Pathway Biomarkers of Cancer
- Application to predict impact of mutations
- Pan-Cancer initial look

# Outline

- Application to predict impact of mutations
- Pan-Cancer initial look

# Main Approach: Detailed models of gene expression and interaction

# Main Approach: Detailed models of gene expression and interaction

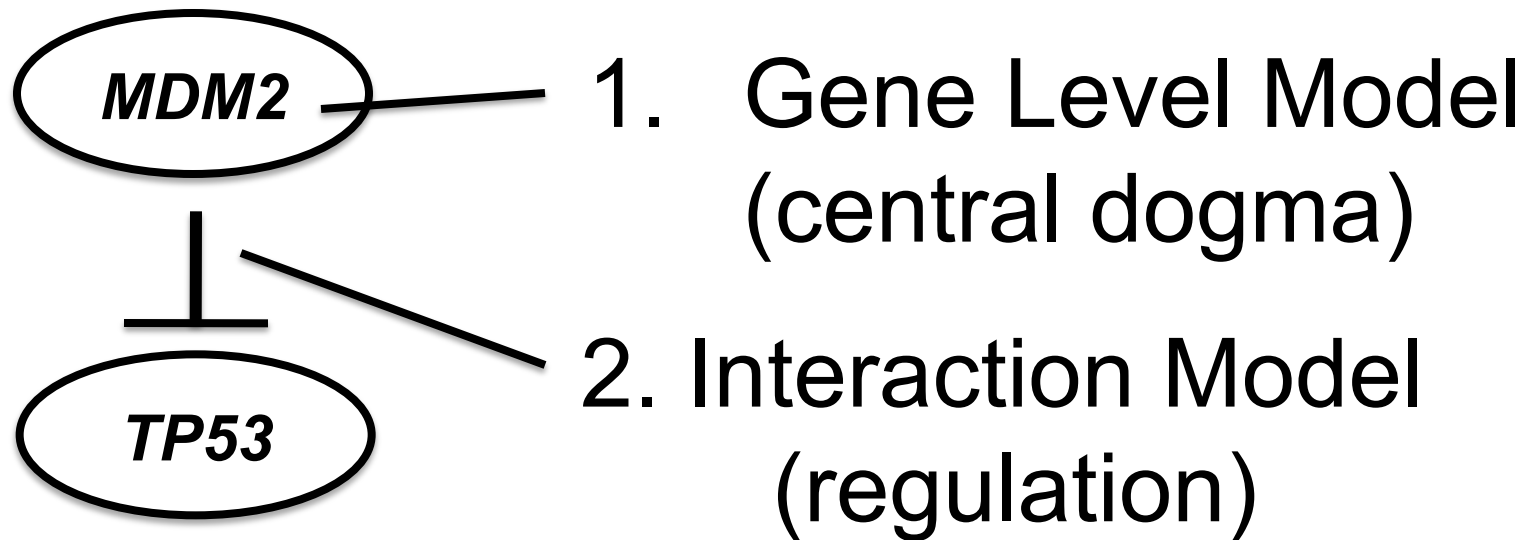

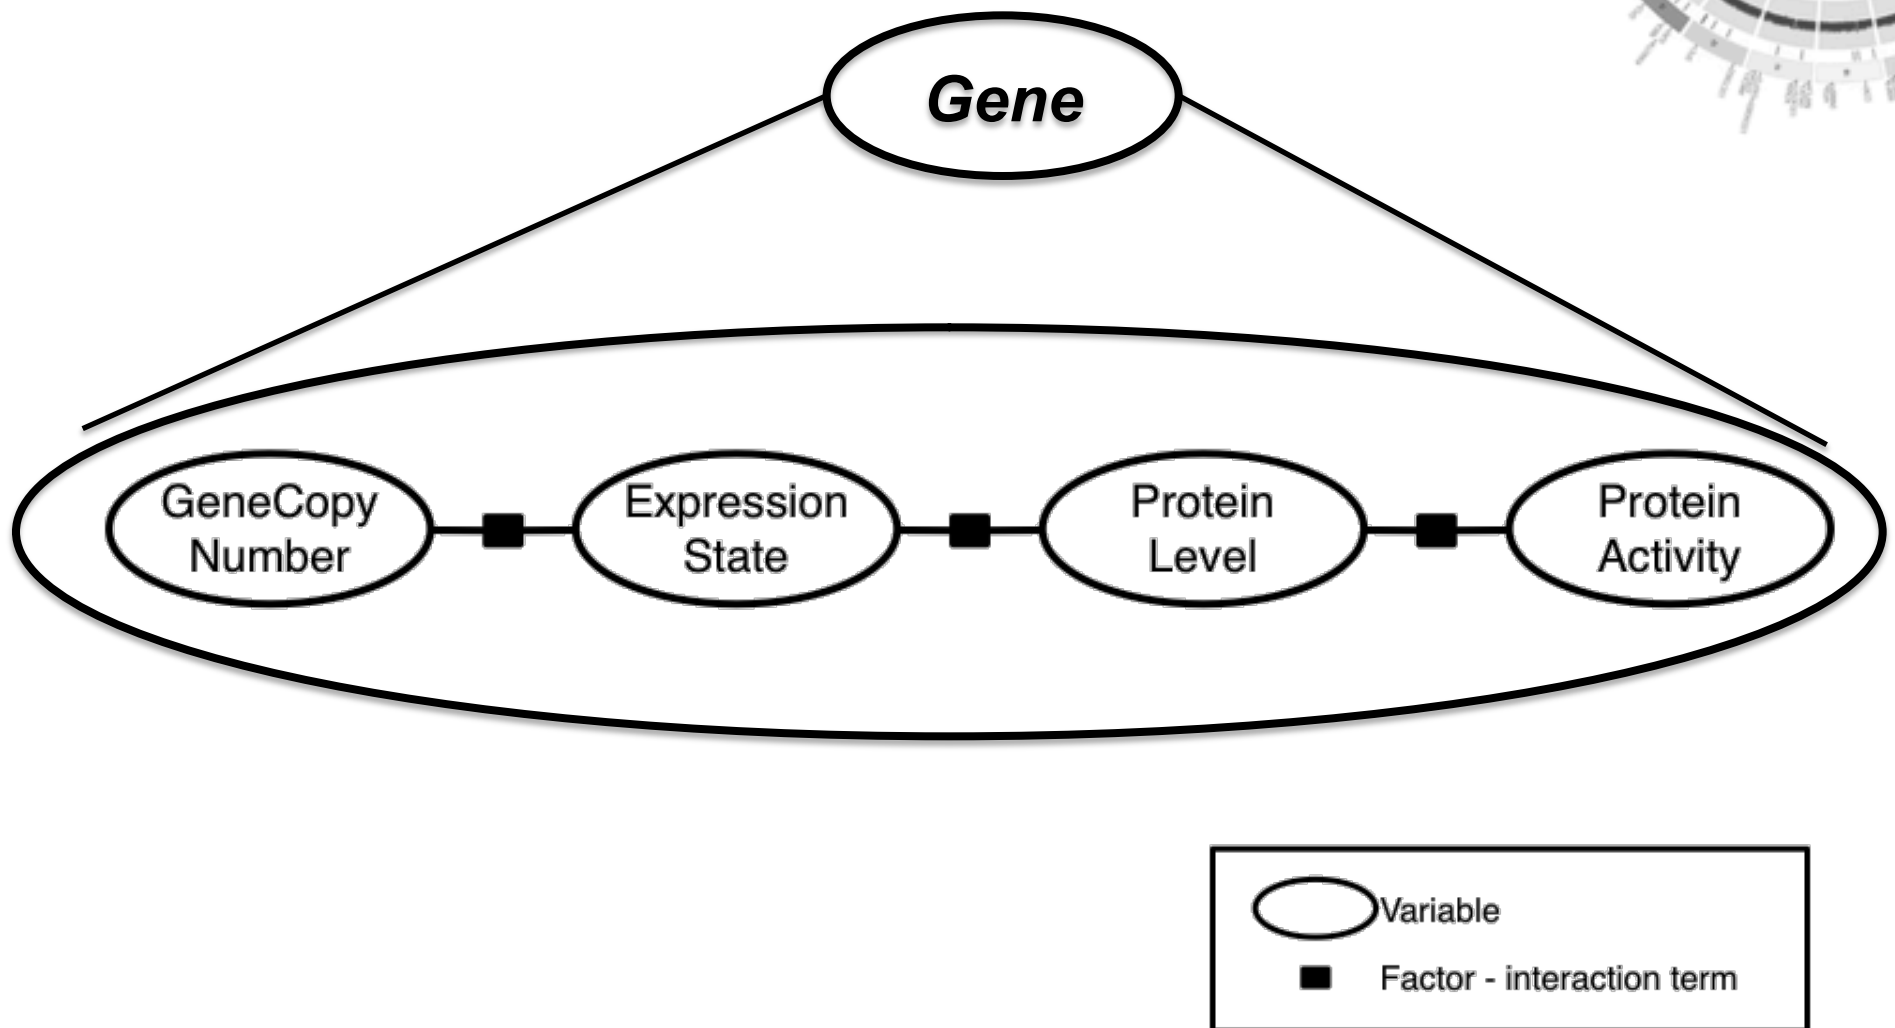

# Main Approach: Detailed models of expression and interaction

Two Parts:

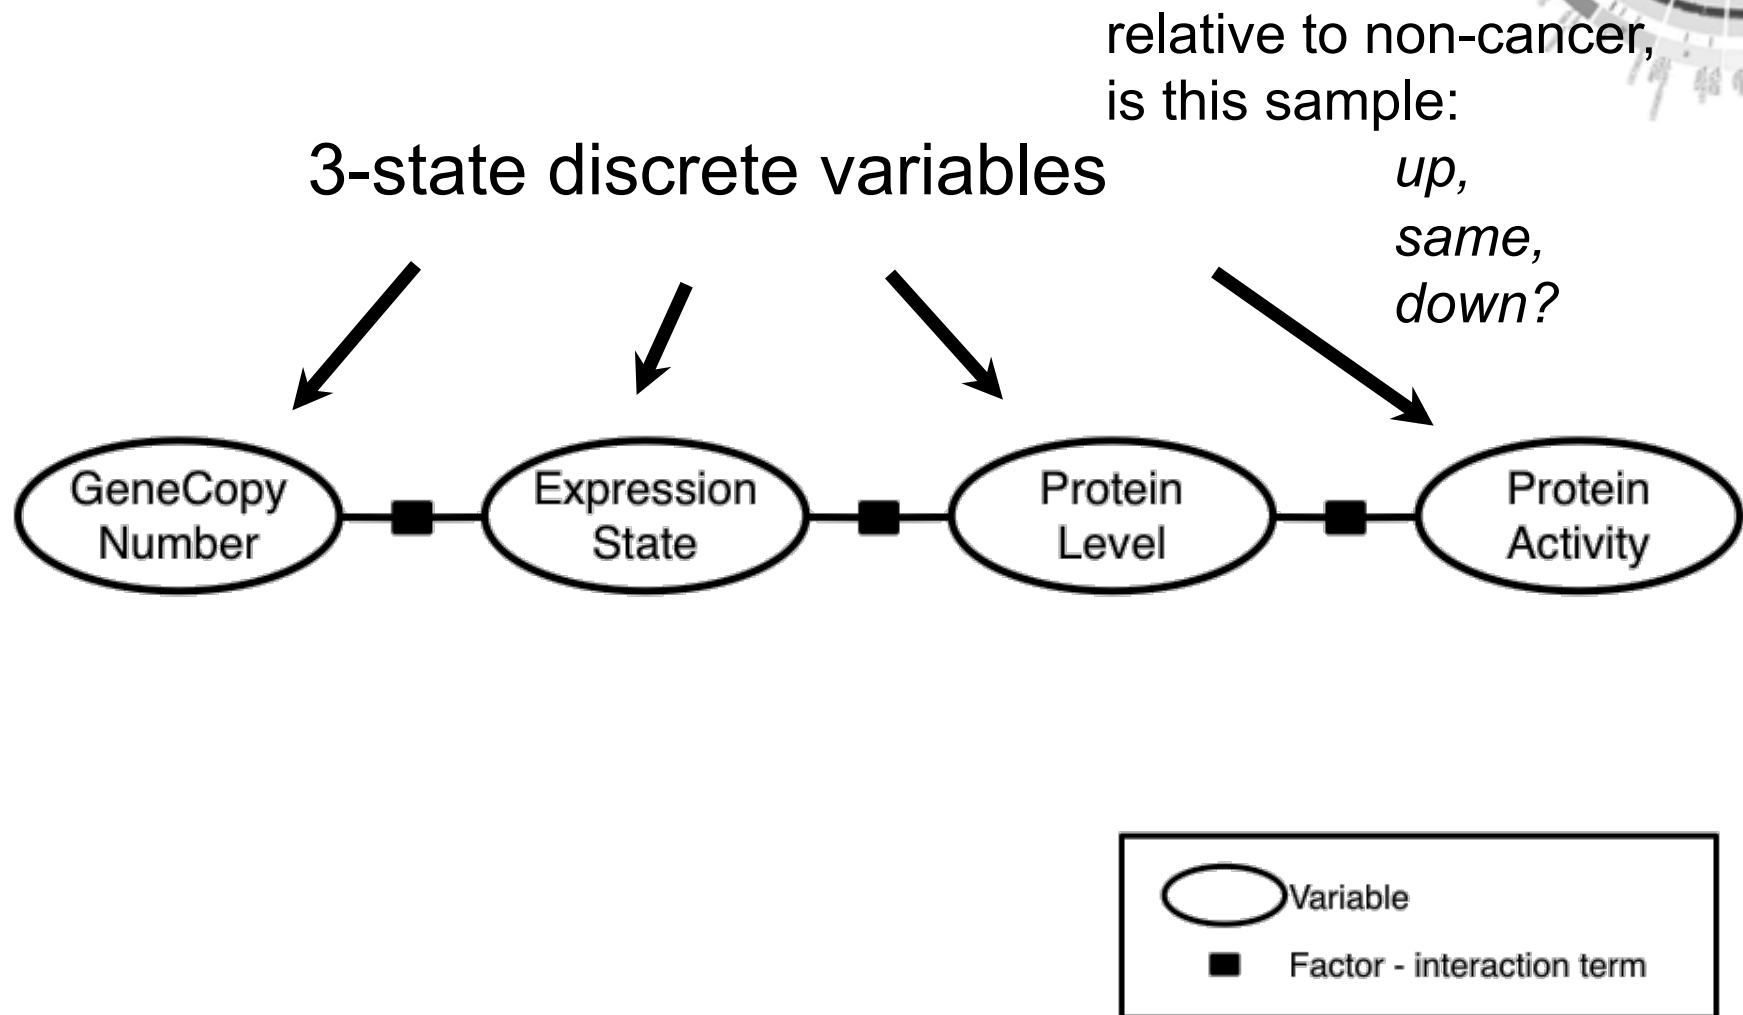

# Pathway Recognition Algorithm Using Data Integration on Genomic Models (PARADIGM)

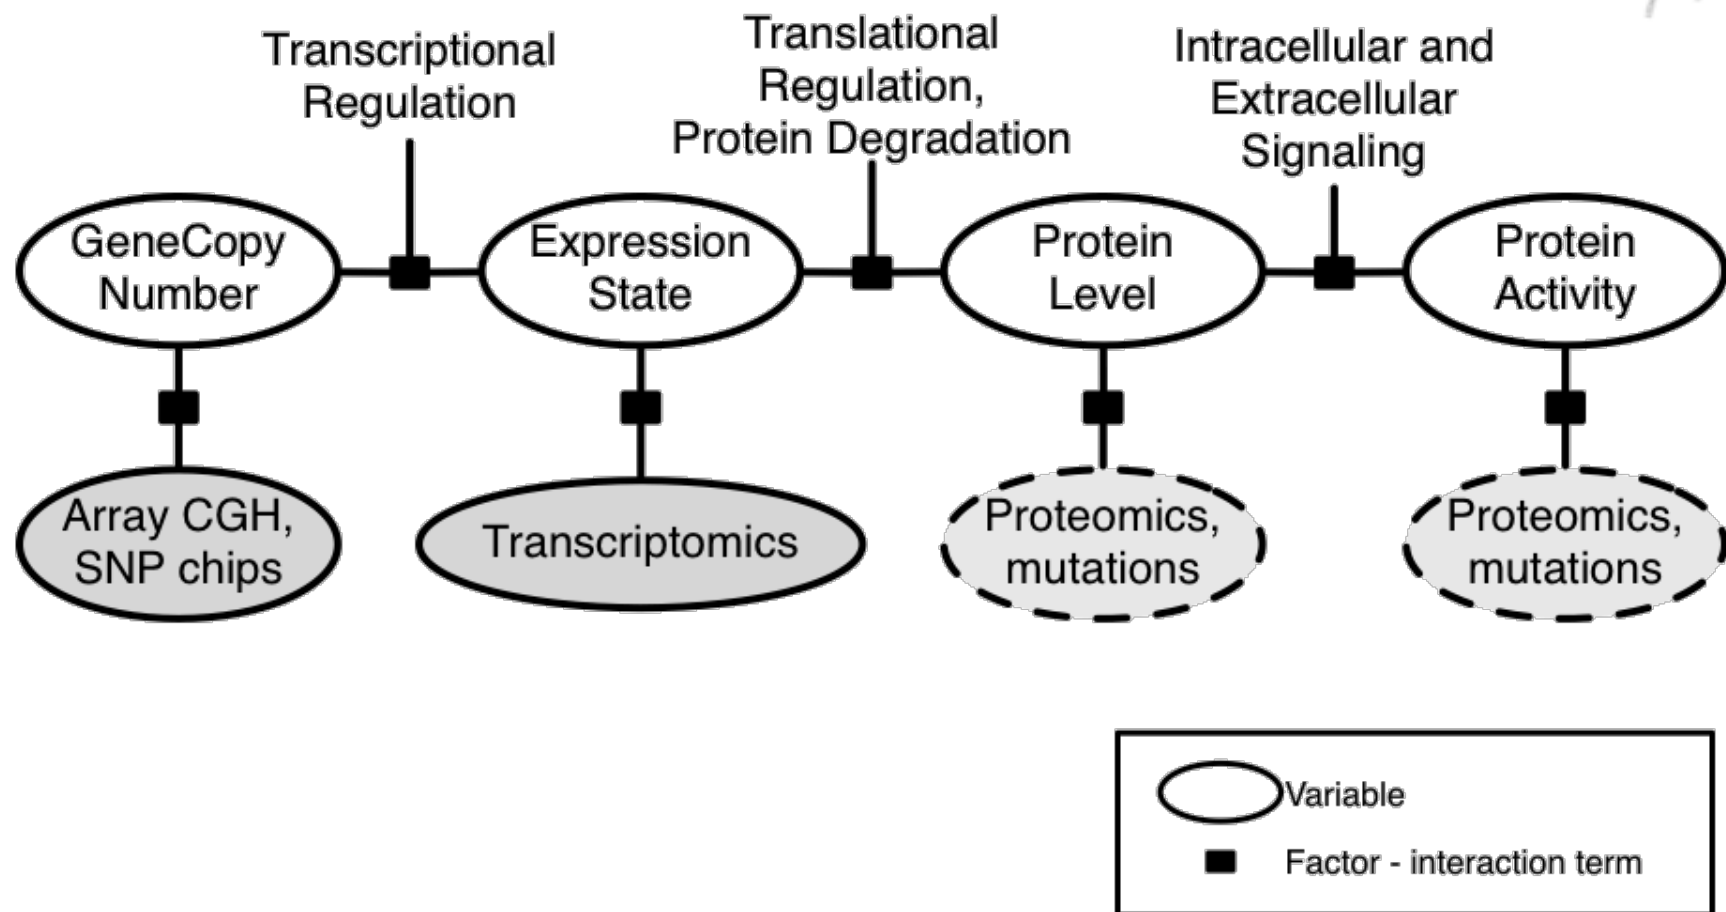

# PARADIGM

## Gene Model to Integrate Data

# PARDIGM Gene Model to Integrate Data

# Interactions Matter

- Given information about the expression of TP53 alone
- Reasoning predicts apoptosis is in tact in these cells.

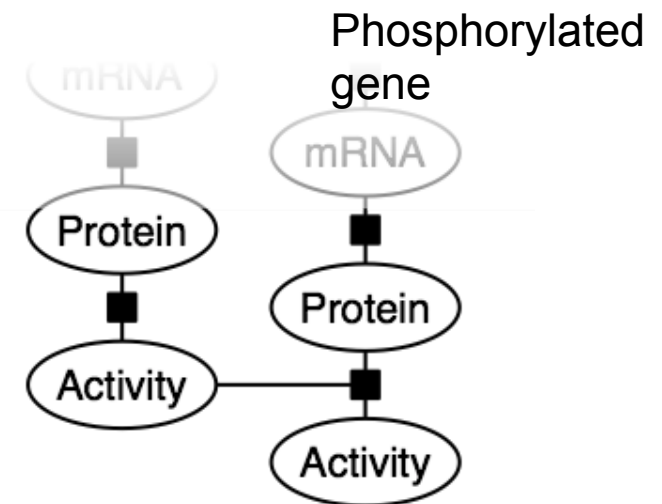

# Interactions Matter

- Given the interaction and data about MDM2.
- apoptosis inference reversed

Inference using all neighbors

Inference using downstream neighbors

Inference using upstream neighbors

# RB1 Loss-of-Function (GBM)

# RB1 Network (GBM)

Sam Ng

The Cancer Genome Atlas 

# RB1 Discrepancy Scores distinguish mutated vs non-mutated samples

# RB1 discrepancy distinction is significant

- Given the same network topology, how likely would we call a gain/loss of function
  - Background model: permute gene labels in our dataset
  - Compare observed signal score to signal scores (SS) obtained from background model

# TP53 Network

PARADIGM upstream  
Expression  
NFE2L2 Mutation

# Gain-of-Function (LUSC)

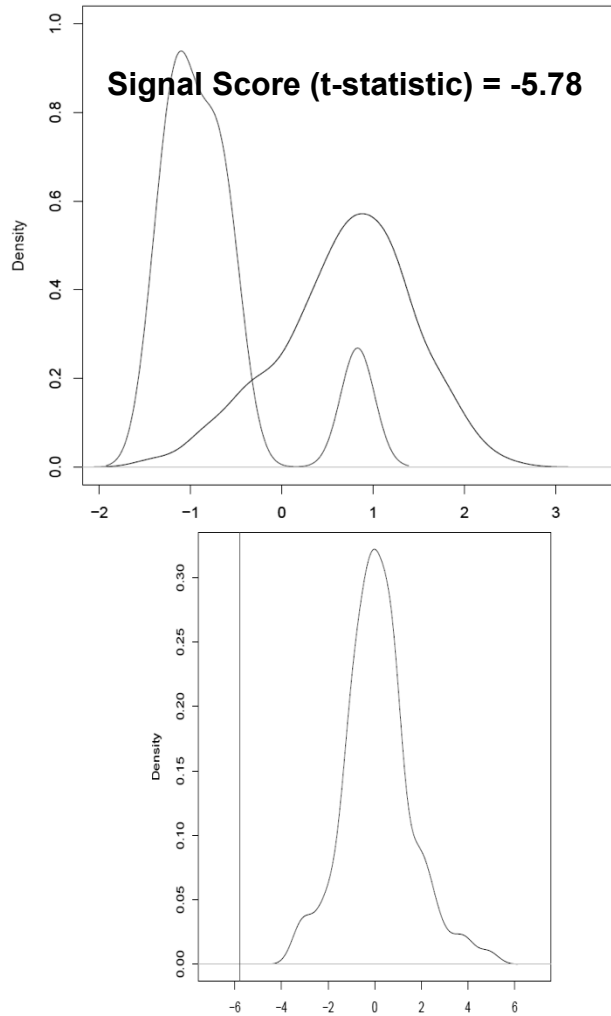

# NRF2 Network (LUSC)

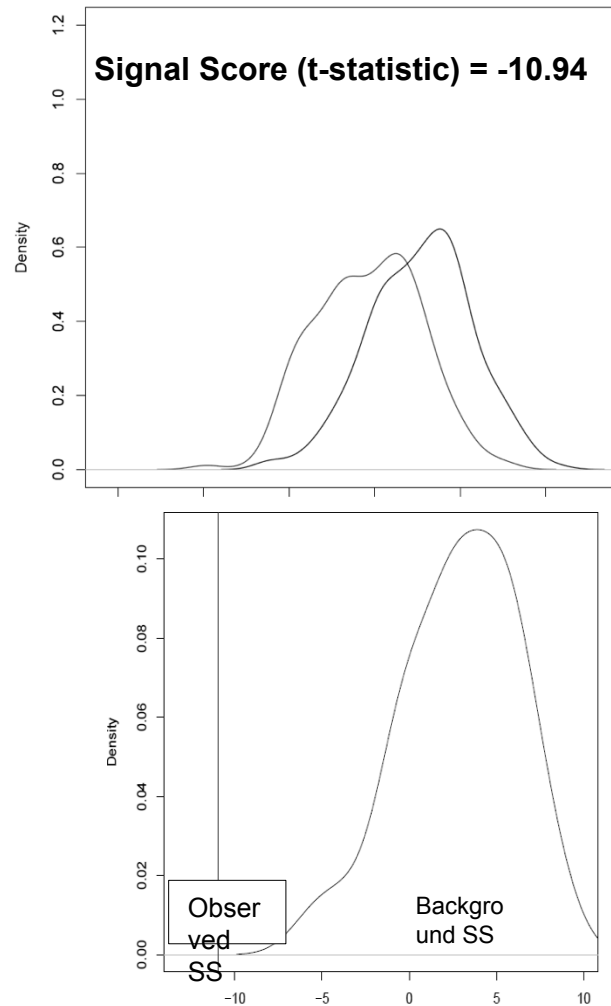

# Discrepancy scores are sensitive

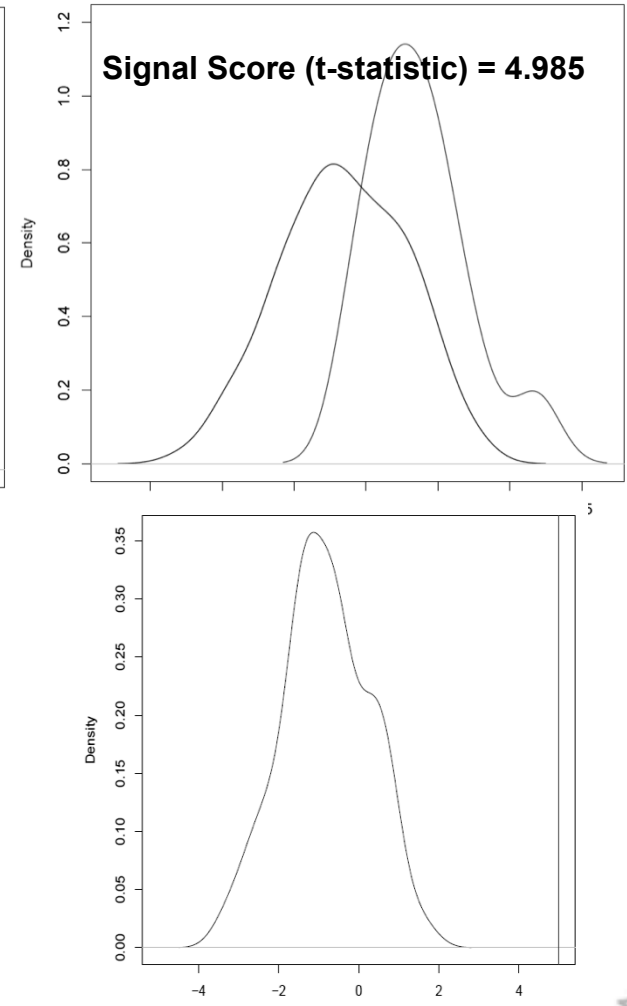

**RB1**

**TP53**

**NFE2L2**

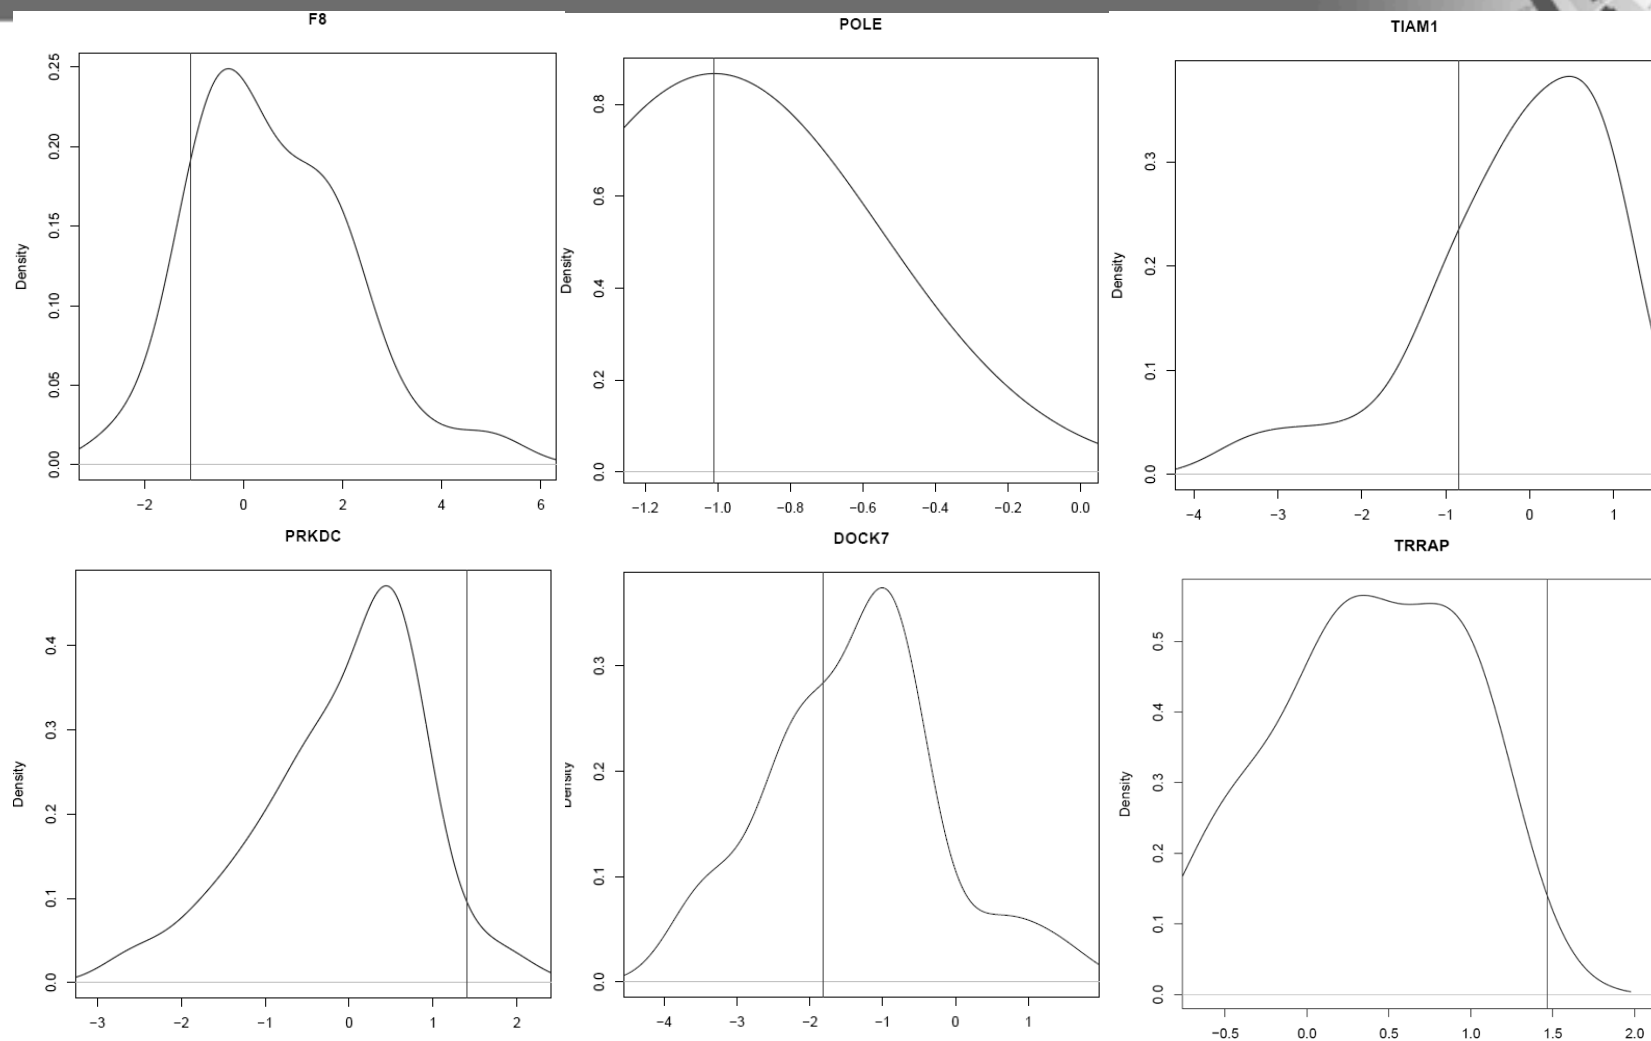

## Passenger Mutations should not have distinctive discrepancies

- Is the discrepancy specific?
- Negative control: calculate scores for “passenger” mutations
- Passengers:
  - insignificant by MutSig ( $p > 0.10$ )
  - well-represented in our pathways
- Discrepancy of these “neutral” mutations should be close to what’s expected by chance (from permuted)

# Discrepancies of Passenger Mutations are NOT distinctive

# What about when we don't have pathway information for a gene?

Ted Goldstein

# Outline

- Integrated Pathway Approach
- Application to find Pathway Biomarkers of Cancer
- Application to predict impact of mutations
- Pan-Cancer initial look

## Sub-type connections across cancers can be explored with pathway activities.

- Do samples of one subtype share pathway activities with another subtype?
- May provide therapeutic option
  - E.g. “rare toe carcinoma” has HER2-amplified signature; try herceptin on “rare toe carcinoma” (E. Collisson)
- Unsupervised analysis: compare direct signatures
- Supervised analysis
  - Train computer to recognize subtype X. Does it recognize subtype Y?
  - Perform *reciprocal prediction*: Also train on Y to predict X.

# Is there a basal disease?

TCGA Breast

Different Breast Platform

Cell line models

TCGA Ovarian

# Is there a basal disease? – BRCA vs OVCA

- TCGA ovarian more like basal than luminal breast

# Supervised: OVCA score as basal on On basal vs. luminal predictors

Serous Ovarian

# Basal predictors separate OVCA subtypes.

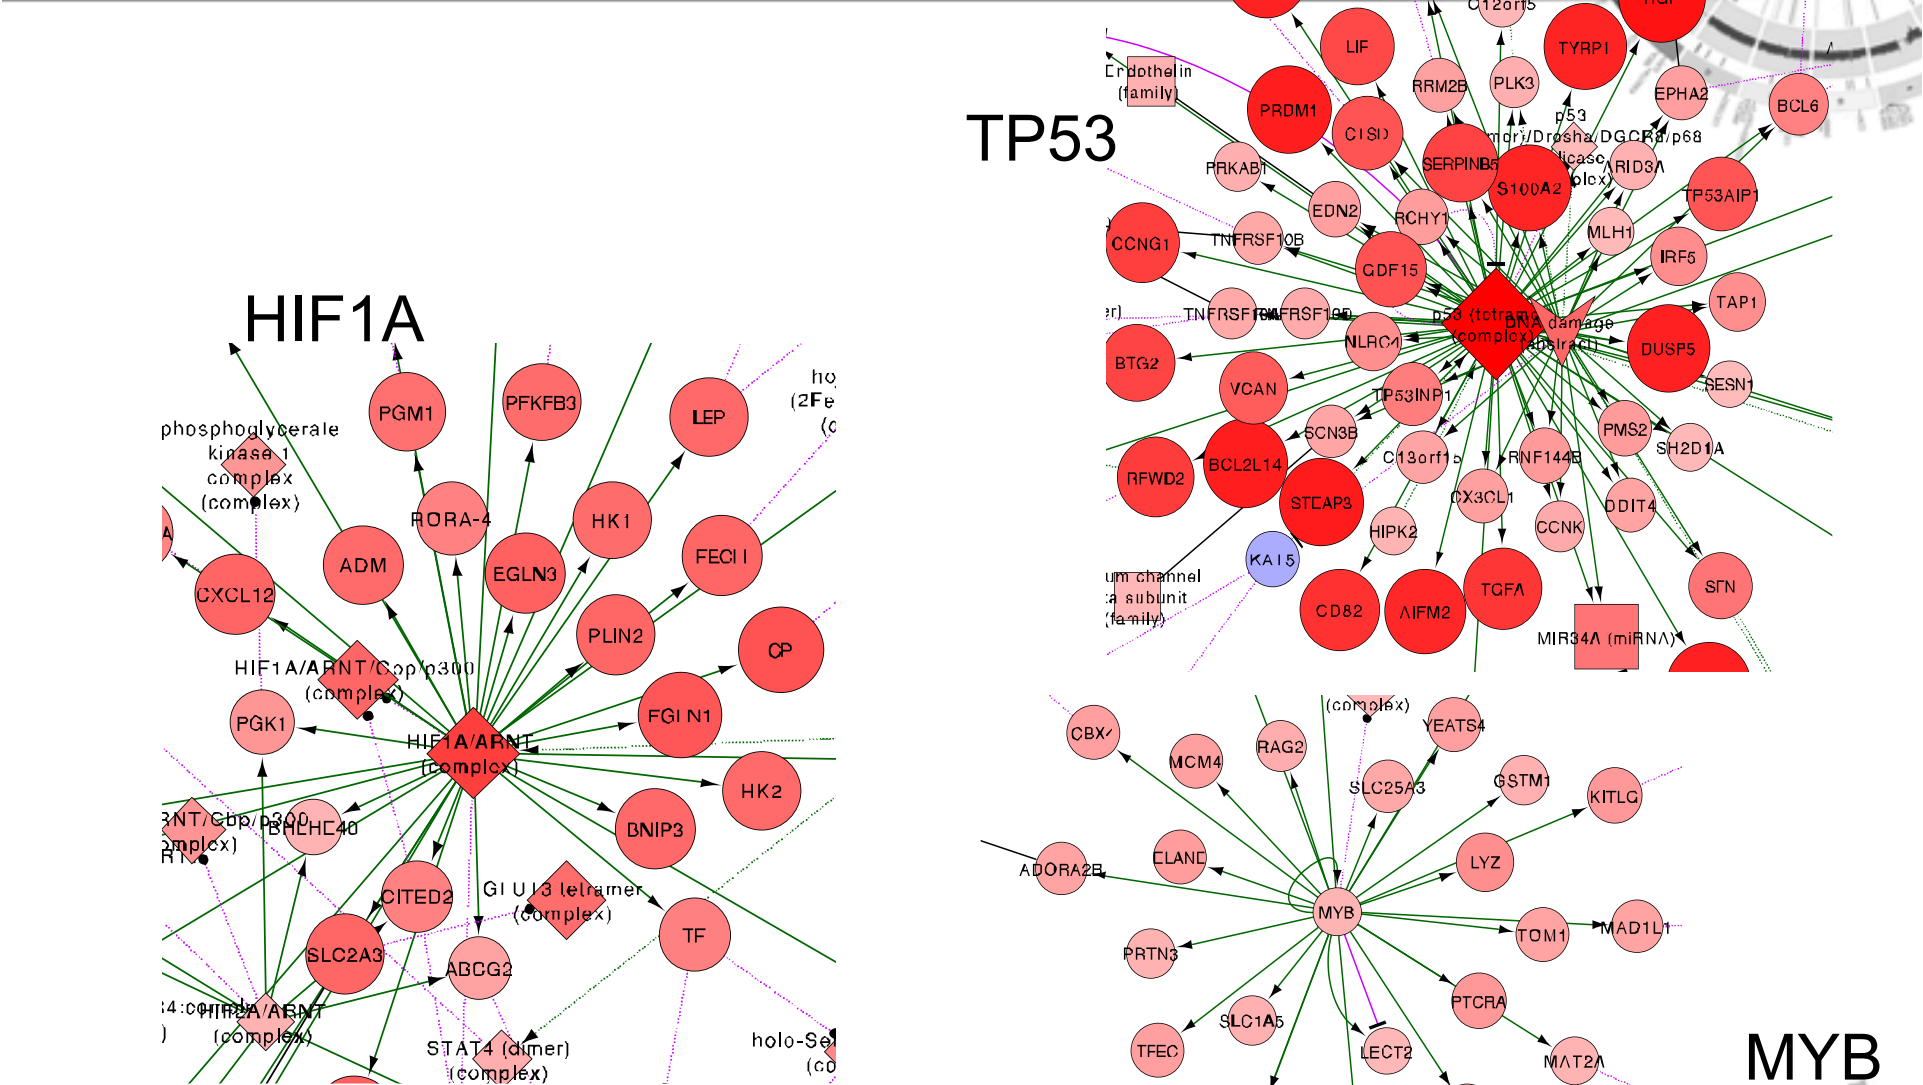

# Lung to breast comparison

- Training LUSC vs. LUAD -> basal BRCA
  - 70% accuracy (173/250)
- Training basal vs. luminal -> LUSC
  - 94% accuracy (130/138)

# Hubs predictive of basal

# Global Pan-Cancer Map

1382 tumor samples:

	377 OV
	69 KIRC
	251 GBM
	339 BRCA
	117 LUSC
	21 LUAD
	67 READ
	141 COAD

# Navigating the landscape with pathways

- Provides a powerful integration framework for a large number of data types
- Focuses results on known biology
- Provides a method to stratify patients more accurately than using the original data
- Sub-networks are predictive markers and can be used to simulate scenarios (like drug inhibition)
- Allows integration of data across cohorts in different cancers
